Review Practice: Chapters 14 & 15

- 1. Consider $f(x, y) = x^2 + 2x y$
 - (a) Find all first and second partials
- fx = 2x+2, fy=-1; fx=2, fyy=0, fxy=fyx=c

- (b) Find the gradient
- (c) What types of graphs are the level curves of f? $\nabla f = \langle 2 \times + 2, -1 \rangle$

$$K = x^{2} + 2x - y$$

$$Y = x^{2} + 2x + K \rightarrow \text{upward parabolas}$$

$$Y = (x + 1)^{2} + (K - 1) \quad \text{vertex} : (-1, K - 1)$$

2. Find all critical points of $f(x,y) = x^3 - 12x + y^2$ and classify them using the second derivative test.

$$\vec{O} = \nabla f = \langle 3x^2 - 12, 2y \rangle$$

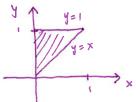

$$x = \pm 2, \quad y = 0$$

$$\vec{D} = f_{xx} \cdot f_{yy} - f_{xy}^2 = (6x)(2) - 0 = 12x$$

$$\vec{D}(2,0) > 0, \quad f_{xx}(2,0) > 0 \Rightarrow \text{ local min at } (2,0)$$

$$\vec{D}(-2,0) < \vec{D} = \vec{D}(-2,0) < \vec{D} \Rightarrow \vec{D}(-2,0)$$
Saddle point at $(-2,0)$

- 3. If x = f(x, y) and x = g(r, s) and y = h(r, s) use chain rule to find $\frac{\partial z}{\partial s}$
 - $\frac{\partial z}{\partial c} = \int_{x} \frac{\partial x}{\partial s} + \int_{y} \frac{\partial y}{\partial s}$ $\frac{\partial z}{\partial s} = f_x(g,h)g_s + f_y(g,h)h_s$
- 4. Compute by changing the order of integration: $\int_0^1 \int_x^1 y^2 \sin(xy) \ dy \ dx$

$$= \int_{0}^{1} y^{2} \sin(xy) dx dy$$

$$= \int_{0}^{1} -y^{2} \frac{\cos(xy)}{y} dy$$

$$= \int_{0}^{1} -y \cos(y^{2}) + y dy$$

$$= -\frac{\sin(y^{2})}{2} + \frac{y^{2}}{2} \Big|_{0}^{1} = \frac{1}{2} \left(-\sin(1) + 1\right)$$

5. Compute $\int \int_D x \, dA$ where D is the region in the first quadrant between $x^2 + y^2 = 1$ and $x^2 + y^2 = 2$.

$$\iint_{D} x dA = \iint_{0}^{\sqrt{2}} \int_{1}^{\sqrt{2}} \cos \theta \cdot r dr d\theta = \int_{0}^{\sqrt{2}} \cos \theta d\theta \cdot \int_{1}^{\sqrt{2}} r^{2} dr$$

$$= \left[\sin \theta \right]_{0}^{\sqrt{2}} \cdot \left[\frac{1}{3} \right]_{1}^{\sqrt{2}}$$

$$= \left[\frac{1}{3} \left(\frac{3}{2} \right)_{2} \right]_{1}^{\sqrt{2}}$$

6. Compute $\iint \int_E z \ dV$ where E is the region in the first octant between $y^2 + z^2 = 1$ and x + y = 2.

$$\iint_{E} Z dV = \iint_{0}^{2-y} Z dx dA$$

$$= \iint_{0}^{2-y} 2 dx = \iint_{0}^{2} Z \sin \theta - \sin \theta \cos \theta dx d\theta = -\frac{1}{3} \cos \theta - \frac{1}{4} \sin \theta \cos \theta d\theta = -\frac{1}{8} + \frac{2}{3}$$

7. If the cylinderical coords of a point are $(2\sqrt{3}, 3\pi/4, 2)$ find the sphereical coords of the point.

$$(r_{1}\theta, z) = (2\sqrt{3}, 3\pi/4, 2) \rightarrow (f_{1}, \theta, \varphi) = (4, 3\pi/4, \pi/3)$$

$$x = 2\sqrt{3} \cos^{3}\frac{\pi}{4} = \sqrt{6}$$

$$y = 2\sqrt{3} \sin^{3}\frac{\pi}{4} = \sqrt{6}$$

$$z = 2$$

$$2 = 4 \cos \varphi$$

$$\cos^{2}\varphi = \frac{1}{2} \Rightarrow \varphi = \pi/3$$
